

This week at Betterzon we are going to tell you about the progress we made with our infrastructure and defining our requirements.

We're using the *Software Requirements Specification* template for the Rational Unified Process. The Document is part of the [wiki](#) section in our GitHub repository. After we specified our requirements, we were able to develop a "Use-Case Diagram":

As you can see, it's quite simple. That is because we're aiming for an easy-to-use interface that's not overloaded with features. Of course this does not mean that we will never think about expanding the functionality, but first we want to tackle the challenges with our core functionality.

We are also happy that we now have a continuous integration pipeline up and running. For that purpose we use a [Jenkins](#) instance. Since we currently provide all our services from the same public IP, we had to make use of the *Virtual Hosts* and *Reverse Proxy* Features from Apache, to redirect HTTP Request to the right service, based on the Request Header.

Stay tuned for more exiting news to come!
